No. 102 (June 2008) **IACS Model Report for IMO Resolution MSC.215(82) Annex 1 "Test Procedures for Coating Qualification", Section 1.7 - Crossover Test**

EXAMPLE COATING PRODUCER

BALLAST TANK COATING TEST OF 2 * 160 µM EXAMPLE EPOXY PAINT ON EXAMPLE SHOP PRIMER

Table of contents

1 SUMMARY

The coating system, 2 * 160 µm Example Epoxy Paint from Example Coating Producer, applied to Example zinc silicate shop primed panels has been tested in accordance with the IMO Performance Standard for protective Coatings /1/, section 1.7 of appendix 1 to annex 1 without wave movement (crossover test). The coating was applied after 2 months weathering of the shop primer.
The results from the testing show that the Example Epoxy Paint from Example Coating Producer has passed all the requirements given in the Performance Standard for Protective Coatings /1/.

2 SCOPE OF WORK

The following work and tests have been performed:

- Identification of the coating system
- Film thickness measurements and pin hole detection on panels before testing
- 180 days testing in wave tank conditions, but without wave movement
- Evaluation of results after testing, including blister detection, disbonding from artificial holiday and adhesion

3 WORK CARRIED OUT PRIOR TO EXPOSURE

3.1 Identification

The coating system was identified by infrared scanning (by means of a ….(name and model of the instrument)),and by determination of specific gravity (according to ISO 2811 -1) by means of an Pyknometer (name and model of the instrument).

3.2 Surface preparation

Surface preparation was carried out according to the data given in Table B-1 Appendix B.

3.3 Application

3.3.1 Application procedure

Example zinc silicate shop primer was applied to the blast cleaned panels according to the data given in Table 2. The shop primed panel were then exposed out-door for 2 months. The environmental data for the exposure period is given in Appendix A.

Two coats (specified dry film thickness 160 μm per coat) of Example Epoxy Paint were applied to the weathered and cleaned zinc silicate shop primed panel. The application data are given in Table B-2 Appendix B.

3.3.2 Coding

The panel were coded as shown in Figure B-1 in Appendix B.

3.4 Dry film thickness

The dry film thickness measurements were carried out by means of a (name and model of the instrument) dry film thickness unit before testing. Templates, as given in Figure B-2 in Appendix B, were used for the measurements. The results from the measurements are given in Table B-3 in Appendix B.

3.5 Pin hole detection

Pin hole detection was performed on the coated test panel before testing. The detection was carried out by means of a (name and model of the instrument) Pinhole detector at 90 volts.

4 EXPOSURE

The testing was carried out according to the IMO Performance Standard for Protective Coatings /1/. The exposure was started 02.11.07 and terminated 14.06.08.

5 TESTS CARRIED OUT AFTER EXPOSURE

Evaluation of blisters and rust, adhesion, undercutting from scribe and flexibility was carried out according to specifications and standards referred to in the IMO Performance Standard /1/.

6 TEST RESULTS

The results of the product identification are given in Table 1.

The results of the examination of the coated test panels are schematically given in Table 2 and more detailed in Appendix B. Pictures of the panels after exposure are enclosed as Appendix C.

Table 1 Results of analyses (Product identification)

Product	Batch no.	IR identification (main components)	Specific gravity (g/cm^3)
Example, part A	123	Ethyl silicate	0.93
Example, part B	234	NA*	2.21
Example Epoxy Paint Grey, base	345	Epoxy	1.48
Example Epoxy Paint hardener	456	Amide	0.96
Example Epoxy Paint Buff, base	567	Epoxy	1.47

* Identified and spectres stored. No generic correlation to the spectres in the data base found.

Table 2 Results of examination of the coated test samples

Test parameter	Acceptance criteria	Test results	Passed / failed
Pin holes (no)	No pinholes	0	Passed
Blisters and rust [1)]	No blisters or rust	0	Passed
Adhesion values (MPa) [2)]	>3.5 adhesive failure >3.0 cohesive failure	Average: 5.2 Maximum: 6.1 Minimum: 4.2 70 – 80 % cohesive failure 20 – 30 % adhesive failure	Passed
Cathodic disbondment (mm) [3)]	< 8	7.2	Passed
Current demand (mA/m^2) [3)]	< 5	3.3	Passed

1) Details of blister and rust Table B-4 Appendix B.
2) Details of Pull-off adhesion test in Table B-5 Appendix B.
3) Details of Cathodic Protection in Table B-6 Appendix B.

7 CONCLUSION

The results from the testing show that Example Epoxy Paint from Example Coating Producer has passed all the requirements for the crossover test given in the Performance Standard for Protective Coatings /1/.

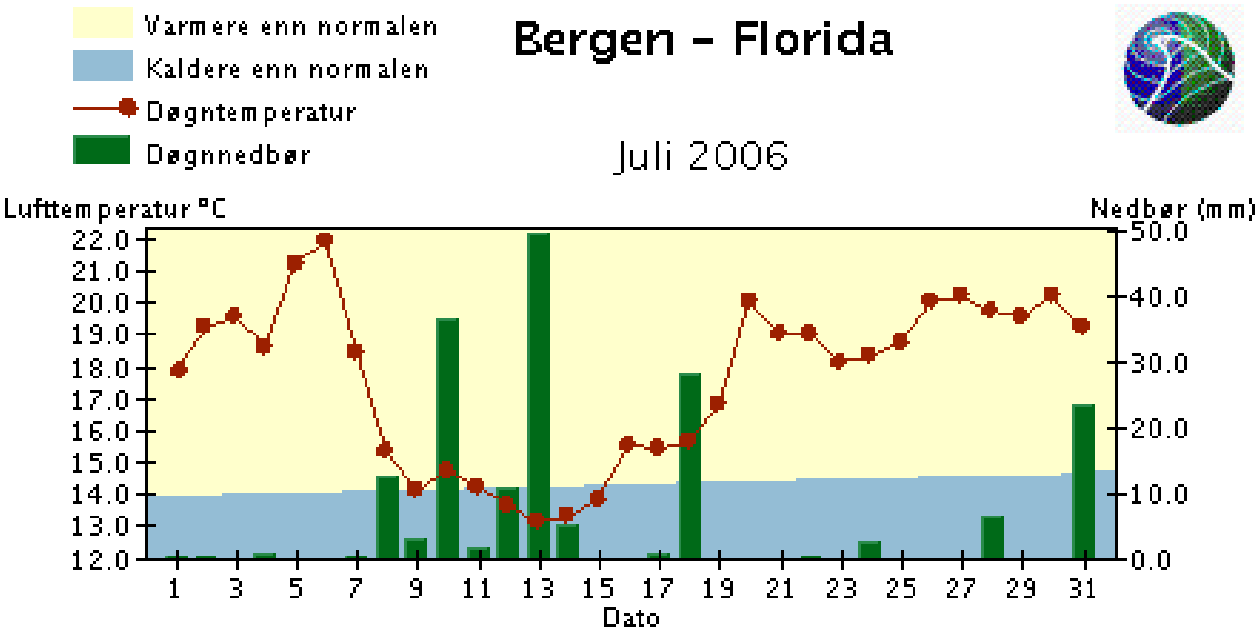
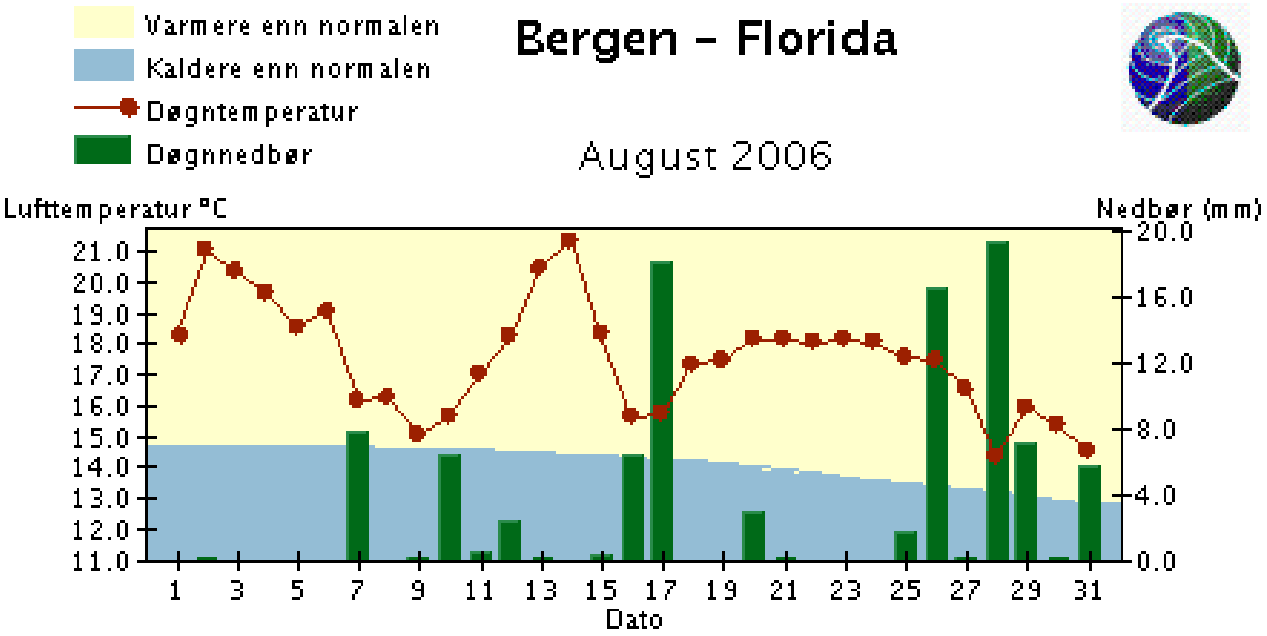
9 APPENDIX A - ENVIRONMENTAL DATA - WEATHERING OF SHOP PRIMED PANELS





10 APPENDIX B - DETAILS OF SURFACE PREPARATION, APPLICATION AND TEST RESULTS

Table B-1 Surface preparation data.

Surface preparation date	November 2007 The prepared panels were stored at ambient in- door conditions until use
Surface preparation method	Blast cleaning
Blasting standard	Sa 2 ½
Abrasive used	AlSil A3+ steel shot
Roughness (µm)	R_{max} 50 -75
Water soluble salts	32, 38 and 40 mg / m^2 Spot check performed on 3 out of 30 panels produced at the same time
Dust and abrasive inclusions	No dust or abrasive inclusions observed by visual examination.
Treatment of shopprimer after weathering	Low pressure washing
Water soluble salts after treatment of shopprimer	Spot check 28, 41 and 38 mg / m^2

Table B-2 Application data.

Coating data:	Shop primer	1st coat	2nd coat
Paint system:	Example red	Example Epoxy Paint Al Grey	Example Epoxy Paint Buff
Manufacturer:	Example Coating Producer		
Date	20.11.07	22.01.08	23.01.08
Time	10:00	10:00	10:00
Batch No. curing agent			
Batch No. base			
Thinner name (if used)			
Batch No. thinner(if used)			
Equipment used	Graco King 68:1	Graco King 68:1	Graco King 68:1
Air pressure (bar)	100	170	170
Size nozzle (inches)	0.021	0.021	0.021
Fan width (º)	60	60	60
Mix. ratio (volume)	A: B = 3:1	3:1	3:1
Volume solid (volume)	30 ± 2	80	80
Wet film thickness (µ)	55-70	275	275
Dry film thickness (µ)	15-25	See Table 3	See Table 4
Thinner (%)	0	0	0
Air temperature (ºC)	25	25	25
Humidity (% RH)	78	80	82
Steel temp. (ºC)	25	25	25
Dew point (ºC)	20	20	20

Present at application of shop primer: nn – MM Group (painter) and mm – laboratory. Present at application of test coating: kk - Example Coating Producer, nn – MM Group, and mm – laboratory.

Table B-4 Development of blisters and rust after exposure.

Code	Description	Blister size	Blister density	Rust	Other defects
EX1ZW2	Bottom wave tank panel with anode	0	0	0	0

Table B-5 Results of the Pull-off adhesion test, wave tank and heat exposed panels.

Panel no.	Adhesion strength (MPa)	Fracture
Bottom wave tank panel with anode W2	5.3	30 % B, 20 % C, 20 % C/D, 30 % D
	4.2	30 % B, 20 % C, 30 % C/D, 20 % D
	6.1	20 % B, 30 % C, 30 % C/D, 20 % D
Average	5.2	70 – 80 % Cohesive failure, 20 – 30 % Adhesive
Max	6.1	
Min	4.2	

A/B	Fracture between the steel surface and 1st coat (shop primer).
B	Fracture in the 1st coat.
B/C	Fracture between the 1st and 2nd coat.
C	Fracture in the 2nd coat.
C/D	Fracture between the 2nd and 3rd coat.
D	Fracture in the 3rd coat
-/Y	Fracture between the outer coat and the glue.

Table B-8 Results of Cathodic Protection (CP).

Panel	Cathodic disbondment (mm)	Blisters / rust	Zinc anode weight loss (g)	Current demand (mA/ m^2)
EX1ZW2	7.2	0	1.2345	3.32

Exposure time: *120 days (Total time 180 days. Each cycle consists of 2 weeks seawater immersion and 1 week exposure in air)*

Utilisation factor: *0.8*

Consumption rate for Zn-anodes: 11.3 kg/A year

Cathodic protection; disbonding from artificial holiday:

"On completion of the test, thoroughly rinse the panel with tap water, taking care not to damage the coating." (From ISO 15711:2003)

"Assess loss of adhesion at the artificial holiday by using a sharp knife to make two cuts through the coating to the substrates, intersection at the holiday. With the point of the knife, attempt to lift and peel back the coating from around the holiday. Record whether the adhesion of the coating to the substrate has been reduced and the approximate distance, in millimetres, that the coating can be peeled." (From ISO 15711:2003)

Additionally IACS interpretation of IMO PSPC: Repeat the cutting and lifting all around the artificial holiday to find the maximum loss of adhesion. Disbonding from artificial holiday can be either loss of adhesion to the steel substrate or between the shop primer and the epoxy coating and shall be less than 8 mm for epoxy based systems to be acceptable (compability test). Cohesive adhesion failure in the shop primer is not to be included as part of the loss of adhesion.
